

Telehealth Eye and Associated Medical Services network - TEAMSnet – The MARVIN Project: Scale, Usability and Evolution

DR blindness is preventable by adhering to accepted standards of care and established best practices

- **Identify all patients with DM**
- **Control confounding factors and co-morbidities**
- **Diagnose level of DR yearly**
- **Apply timely treatment**

Background: Nepal Scenario

- Traditional fundus cameras are difficult to use at expected scale in these types of environments for delivering best practice care and management.
- Impact of technology failures: One of their two cameras has been down since December, with no real plan for getting it back online.
- Impact of environment using traditional retinal imaging devices:
 1. Hard to transport.
 2. Fragile.
 3. Difficult to use.
 4. Variable image quality.
 5. Hard to maintain.

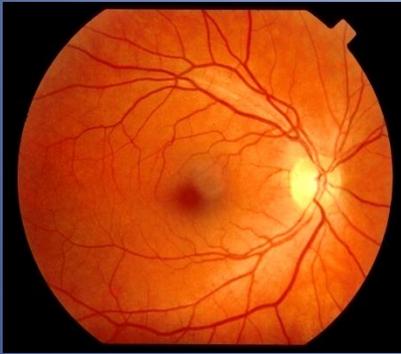

The case for a MARVIN type of system solution really compelling given these types of logistical barriers and issues

Positive Tele-Ophthalmology Impact

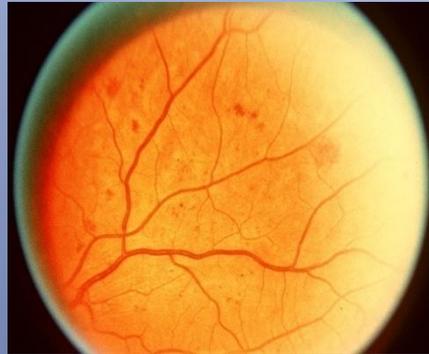

- Indian Health Service Studies: Teleophthalmology **increased access to eye care, saved sight and cost less** than traditional ophthalmology services (Over 100,000 patients)
- Assessed relationship of participation in a diabetes telehealth eye care program with diabetes-related care sequelae (historical data, prospective study design, 14,000 patients)
Telehealth eye care significantly predicted whether subjects:
 - Had a subsequent clinic encounter
 - Obtained subsequent standard eye care
 - Improved HbA1c and LDL-C levels
- *Telehealth eye care programs that combine evaluation, education, and care planning are related to use of recommended care and improvements in diabetes-related health outcomes*

The Relationship of a Diabetes Telehealth Eye Care Program to Other Diabetes Care and Change in Health Outcomes. S. Fonda, S Bursell et al.

Diabetes
Diagnosis

Severe NPDR
PDR

Blindness

What is Needed: A Massively Scalable Retinal Imaging Solution

- Low cost camera- <\$1K with scalable fabrication and distribution
- Small foot print, light weight, portable
- Multi-field capable or single wide field
- Automated
- Improved non-mydriatic performance (2.5 mm pupil diameter) with consistently good image quality
- Interoperability with EHR systems
- Automated lesion detection and diagnosis of level of DR
- Quality Assurance
- Linkage with Chronic Disease Management

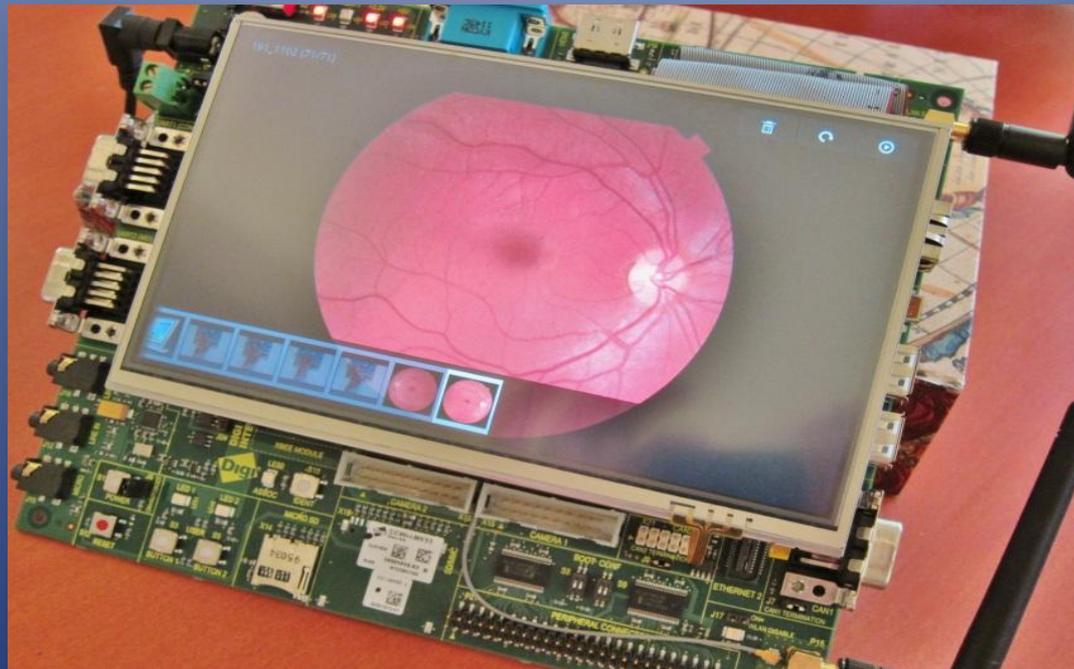

Strategy

- Disperse medical intervention to where the patient is
- On-the-spot assessment and decision support
- Low cost, high usability, mobile
- Quality assurance, uniform images, integration
- Leverage billions invested in smartphone technology

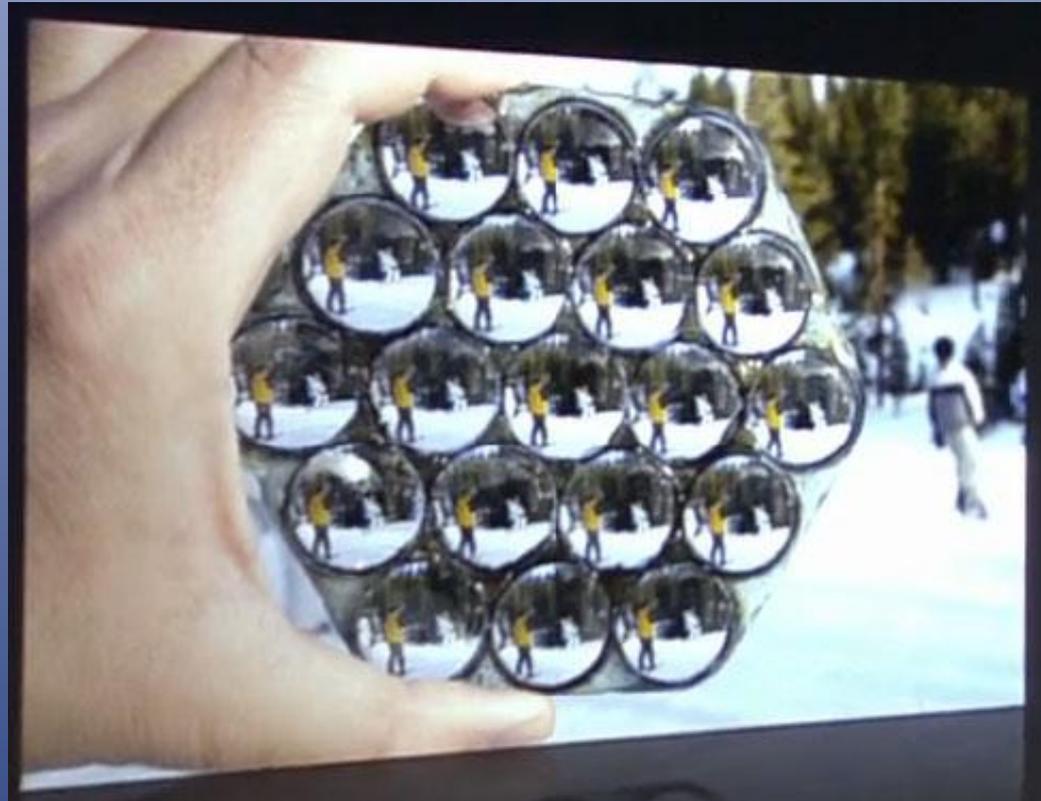

A Mobile Platform

Android or iOS-based tablet provides user interface coupled with a specialized retinal imaging front end comprised of novel optics, light sources and General-Purpose computing on Graphics Processor Units (GPGPU) onboard compute power for image display and diagnostic evaluation of DR through an open platform public API

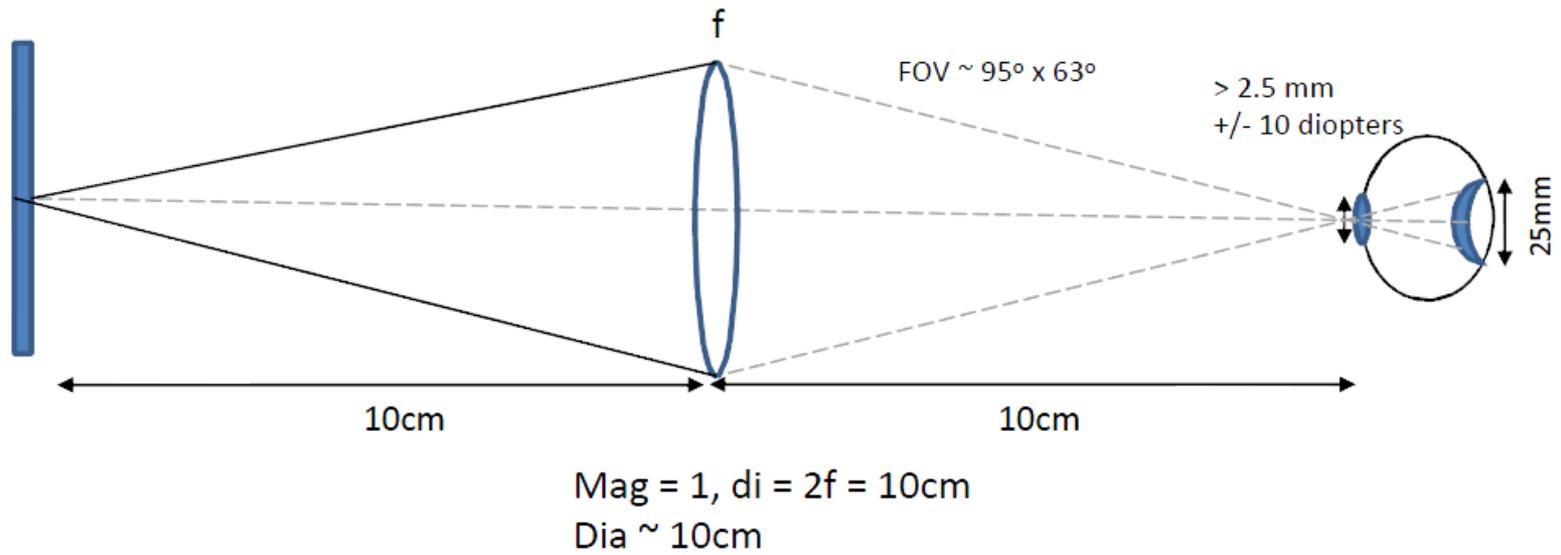

Novel Optics: Plenoptics Technology

Allows focus via software after taking picture;
infinite depth of field.

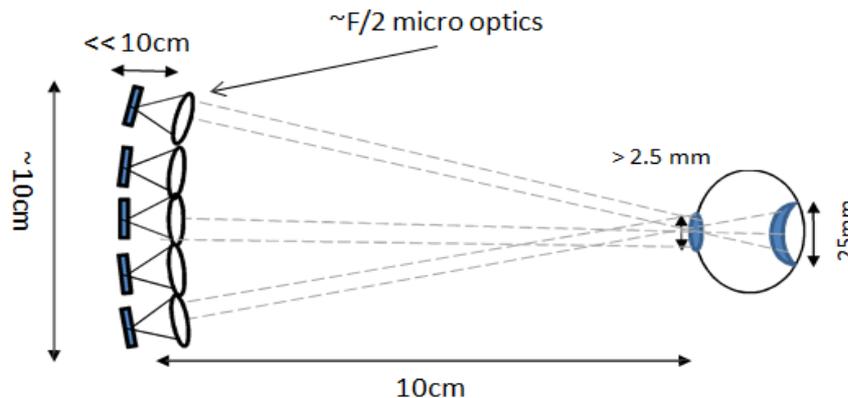

Technology for lenses already in use in mobile phones

Achieving a wide Field of View (Plenoptics)

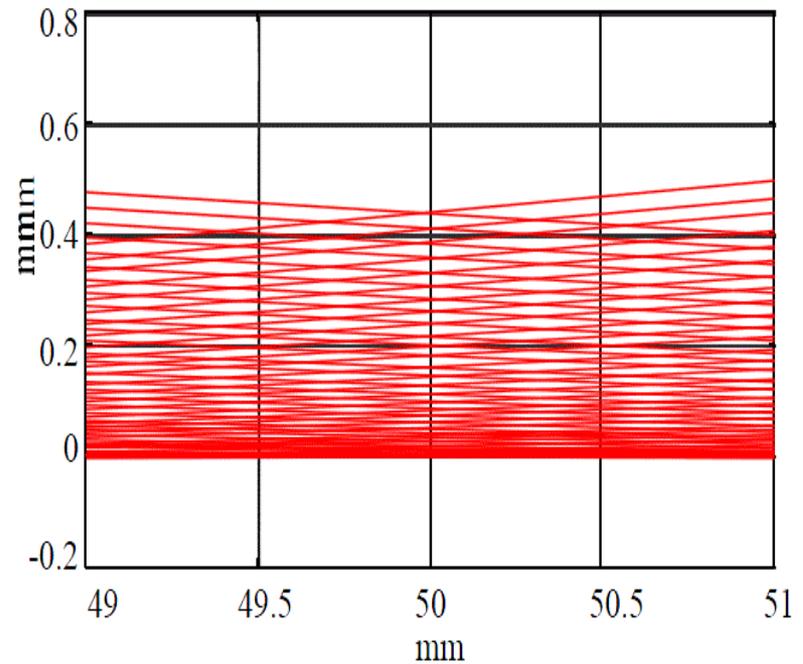

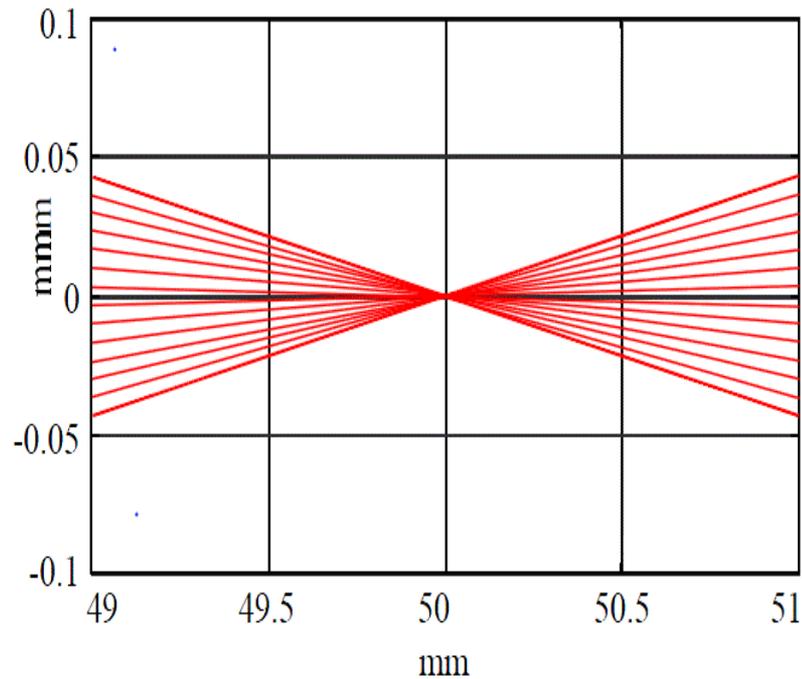

MARVIN CONCEPT

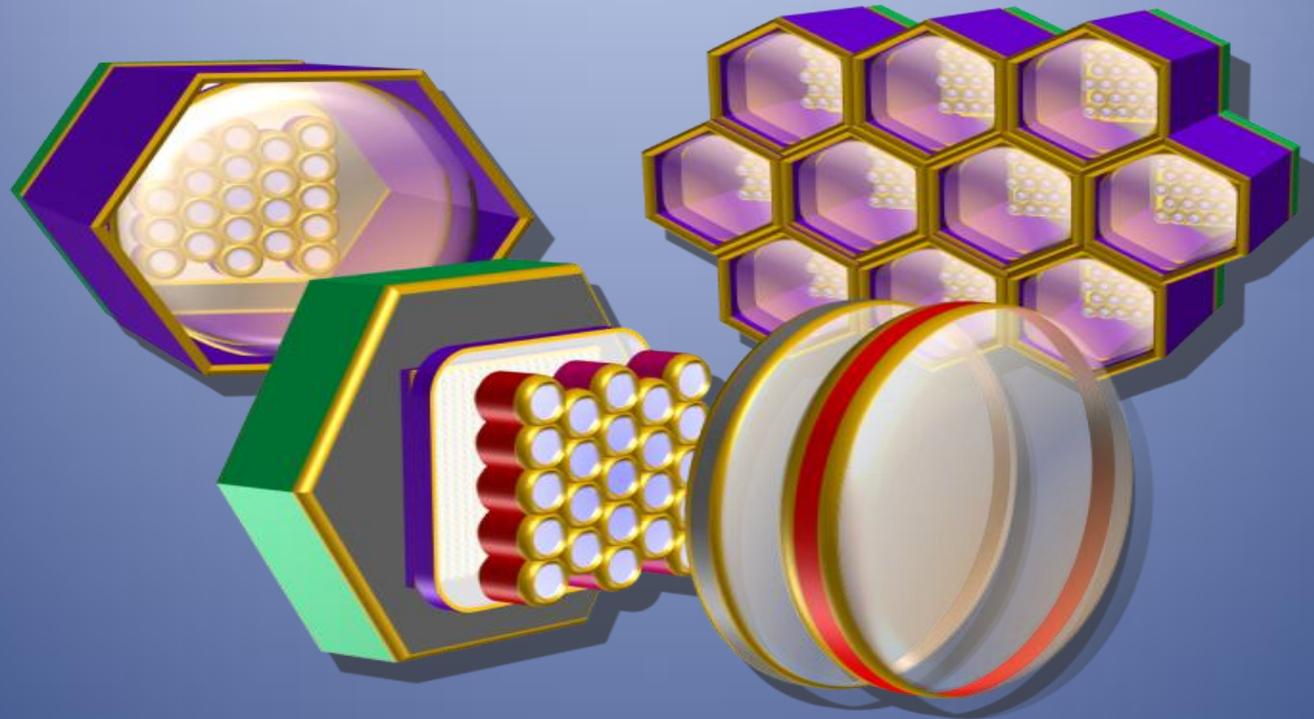

- Focal length of eye $\sim 22\text{mm}$
- Pupil diameter $> 2.5\text{mm}$
- Working F/# of eye $\sim F/8$

- Distant collection/eye geometry forces an effective magnification of $\sim 10\text{cm}/25\text{mm}$ at data collection plane: $\text{Mag} \sim 4$.
- Image points of the retina at the image plane can be spaced at a $\text{mag} = 1$ with $F/2$ optics (Ratio of $F/2$ over $F/8$ is the optical mag)
- $F/2$ optics with 8 micron pixels has a depth of focus ~ 16 microns
- Depth of Field (at the retina) is then ~ 16 microns.

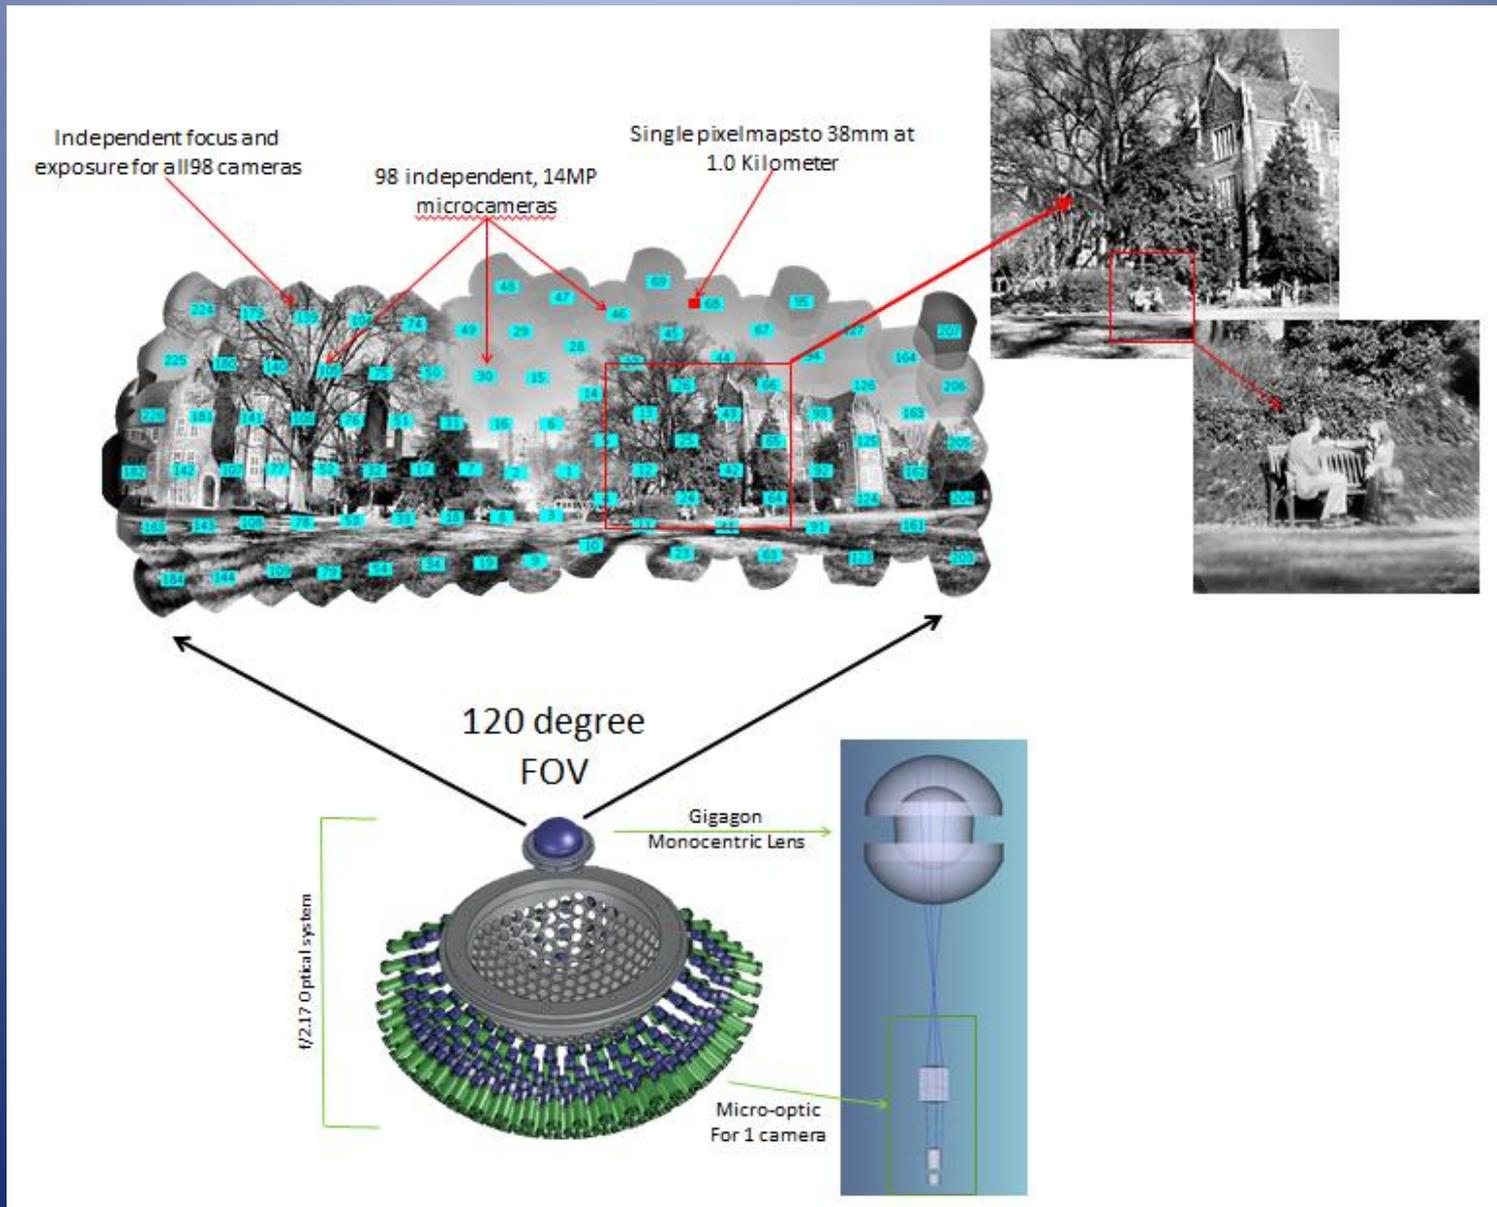

Ray tracing of regular lens shows a zone of sharp focus at 50 mm (left figure). Wavefront coded optics (right figure) show ray density that is uniformly defocussed over a wide range. Sharp images are reconstructed in software.

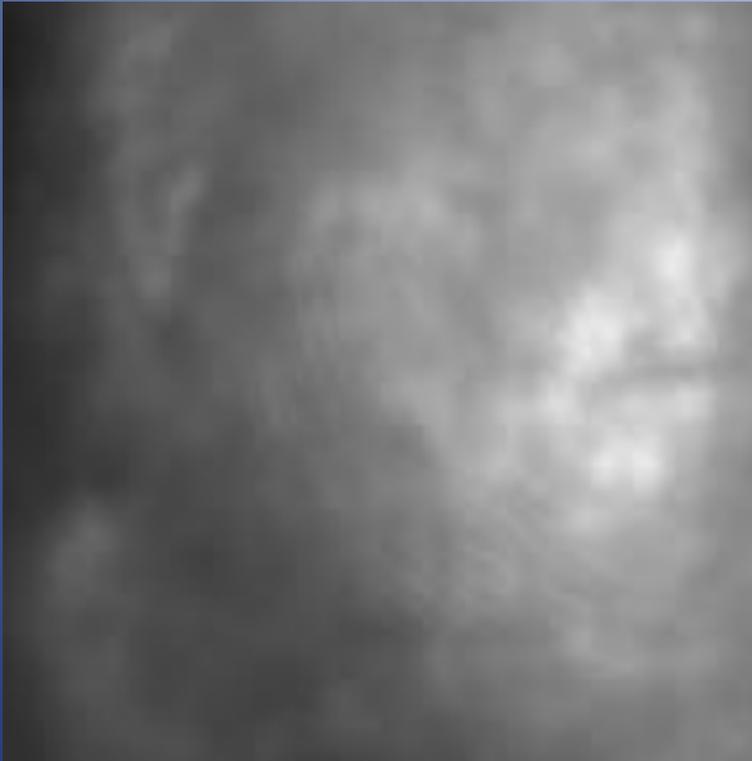

Stacked microcamera array with schematic view of lenses, microlens arrays, wavefront encoding filter and light-sensing array

Aware Multi Aperture Camera

Marvin Wavefront Coding Technology

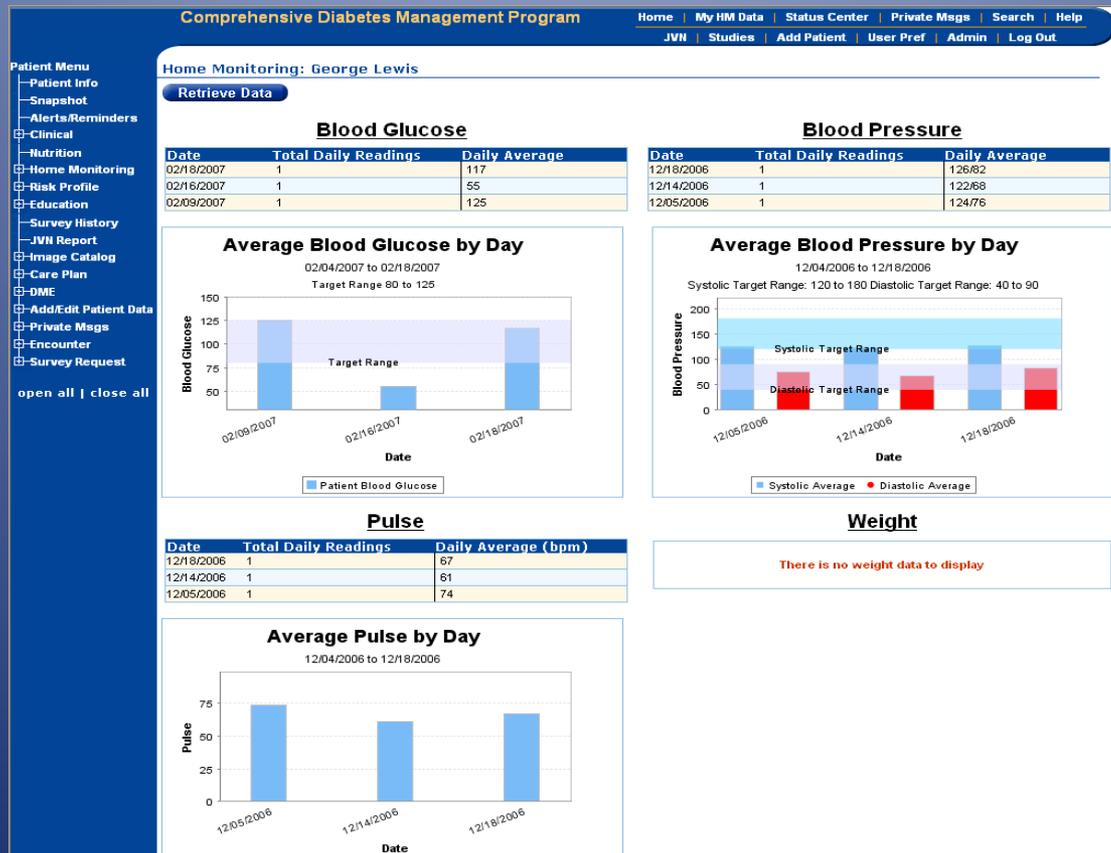

Comparison between traditional imaging of a fingerprint on left and that obtained using wavefront coding of same fingerprint on right

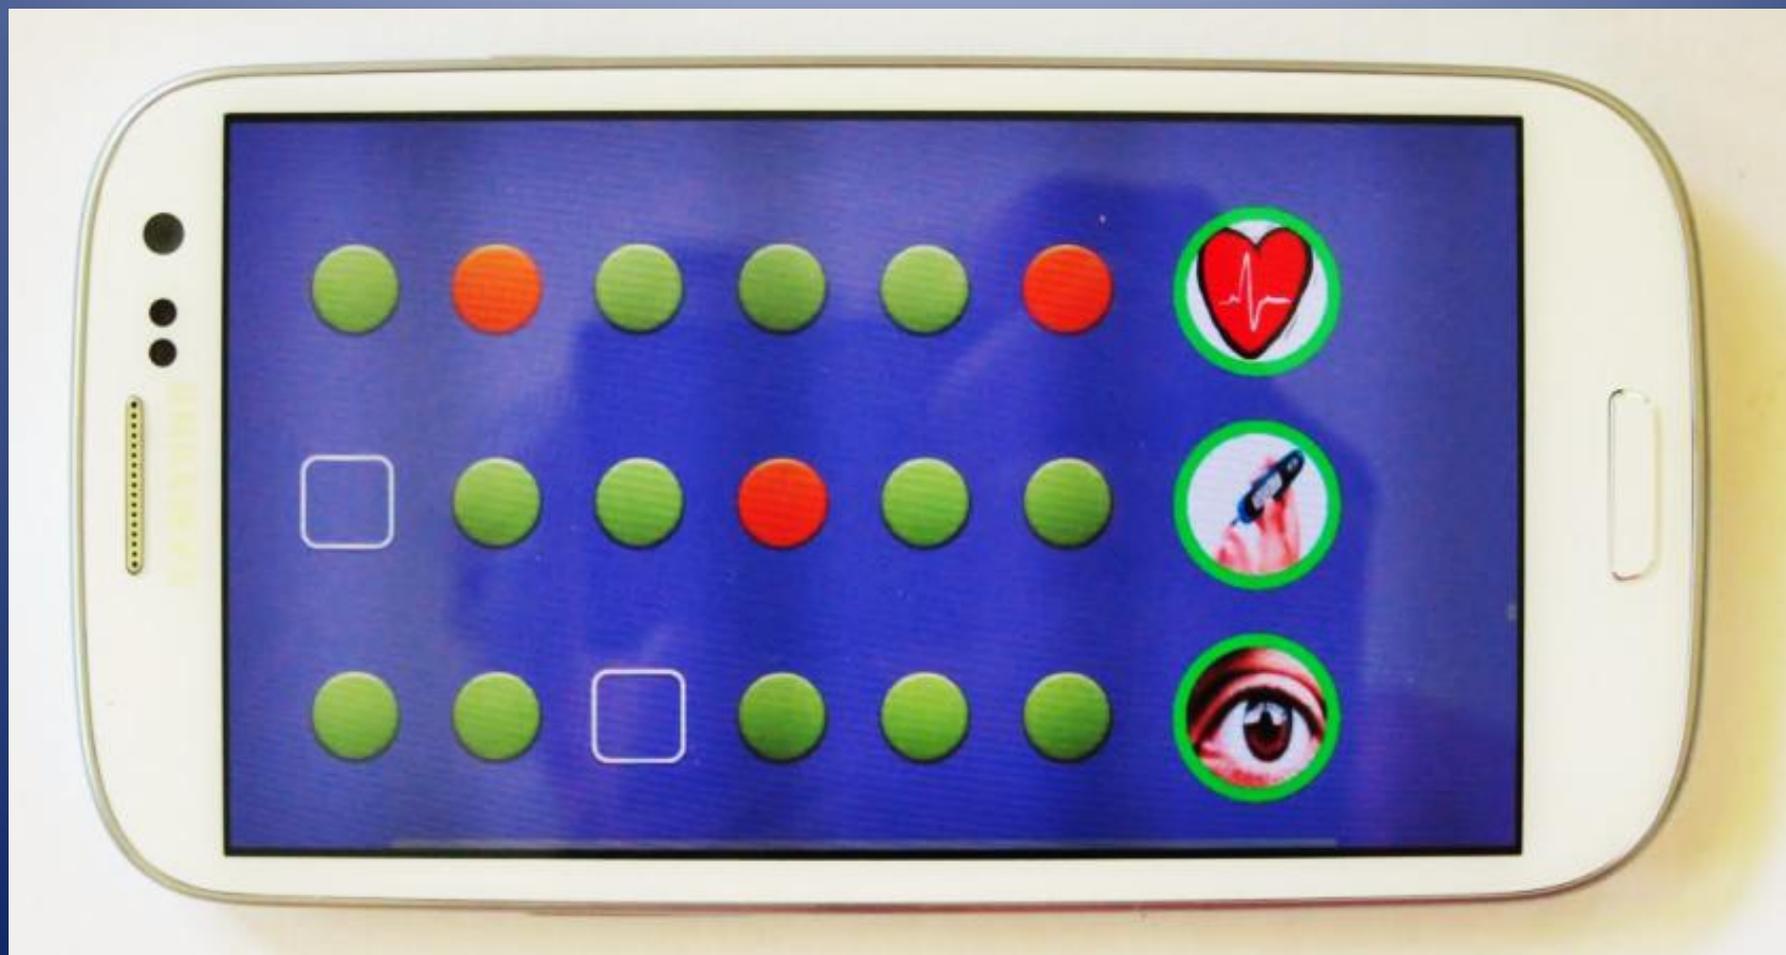

3-D printing of complex parts can take place within a matter of hours.

Remote Monitoring and Mobile Health

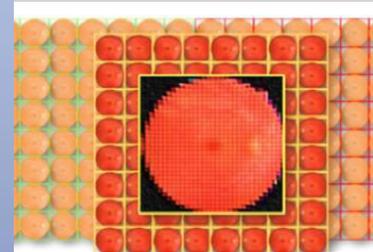

CDMP Application accepts data from mobile remote monitoring devices and provides a platform for aggregation and display of data from multiple devices and applications

Summary

- MARVIN prevents blindness by accessing people into appropriate eye care at massive scale, before they progress to more expensive tertiary care
- MARVIN delivers a complete solution, from GIS-based needs assessment models, to in-the-field diagnosis and patient adherence support, as well as public-health-management informatics.
- MARVIN takes advantage of demographics (services and where the people are). Natural integration with existing social networks of schools, village healthcare workers, *etc.*
- MARVIN as a retinal imaging device is designed to adopt to appropriate field conditions (fits in a backpack, solar powered, locally-replaceable components).
- Massive numbers of retinal studies are accumulated worldwide; they become the basis for improved efficiency, new diagnostic abilities and optimal resource allocation.
- Development capital is required, but this cost is very small given the economic impact of the larger problem.
