Better Operative Outcomes Software Tool

This is a collaborative initiative by IAPB and various eye care INGOs for developing and sharing a simple tool for eye care professionals to achieve better operative outcomes. The design of this tool is based on the PRECOG study. The application is designed for most common platforms and devices. The individual surgeon or hospital can download the respective application, setup into their computer, and enter required data that will help to measure and improve the quality of the cataract surgeries performed by them. An option is made available in this website to share your data and benchmark your outcome against others in the forum. Benchmarking will be done anonymously. We appreciate your active participation towards providing quality eye care.
